## 2021 Annual Report of Japanese Brain Bank Network for Neuroscience Research (JBBNNR)

P-BSP-8

Shigeo Murayama, MD PhD <sup>1</sup>, <sup>2</sup>, Yuko Saito, MD PhD<sup>2</sup>, Masaki Takao, MD, PhD釘Daita Kaneda, MD<sup>4</sup> and Ban Mihara, MD PhD<sup>4</sup> (1)Brain Bank for Neurodevelopmental, Neurological and Psychiatric Disorders, Osaka University, Osaka, Japan, (2)Brain Bank for Aging Research, Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Tokyo, Japan, (3)National Center of Neurology and Psychiatry, Kodaira, Japan, (4)1nstitute of Neuropathology, Fukushimura Hospital, Toyohashi, Japan, (5)Mihara Memorial Hospital, Isesaki, Japan

JBBNNR, whose core is Brain Bank for Aging Research (BBAR), proceeds neuroscience research focused on dementia and neurodegeneration.

Japanese Brain Bank Network for Neuroscience Research (JBBNNR) was established in 2001, whose reader is the Brain Bank for Aging Research (BBAR), the first and only Japanese Brain Bank dedicated for aging and dementia research

BBAR recruited all the members of the Japanese Society of Neuropathology to establish JBBNNR, funded by MEXT in 2001, on the following four conditions: open resource, brain donation, quality control including neuropathological diagnosis, to combine clinical longitudinal studies. National Center of Neurology and Psychiatry (NCNP), Mihara Memorial Hospital and Fukushimura Hospital joined JBBNNR. In 2020. Brain Bank for Neurodevelopmental, Neurological and Psychiatric Disorders (BBNNPD), the first brain bank system in all the universities of Japan, was established in United Graduate School of Child Development, Osaka University and joined JBBNNR.

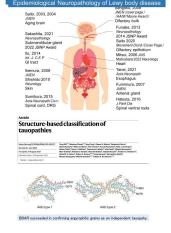

The adjustment through and the first of the constrained and the constraint of the co

In 2021, the pandemic of COVID-19 seriously influenced recovery of postmortem brains viadramatic decrease of autopsy in Japan.

JBBNNR began effort to include legal autopsy to establish suicide bank and autism brain net. The main barrier resides in cultural respect of suicide in Japan, which makes it difficult to obtain the family's consent for brain donation. The solid public support system for autism promised long life without accident and makes it difficult to recover autism brains through forensic autopsy. It was good news that BBNNPD proposed cloud funding in Osaka and successfully received donation of ten million yen.

JBBNNR is based on full autopsy. In 2001, wereported that one third of geriatric population contained Lewy body pathology in the body. We also collaborated Cambridge group and confirmed argyrophilic grains as an independent tauopathy.

JBBNNR continued to contribute neuroscience research, focused on dementia and neurodegeneration, in Japan.
